

## Zoom Boom Training Avondale

Zoom Boom Training Avondale - Zoom Boom Training focuses on correctly training prospective operators on variable reach forklifts. The training objectives include gaining the understanding of the equipments physics and to define the responsibilities of the operator. This program adheres to North American safety standards for lift trucks. Zoom boom training and certification is available at our site or at the company's location, provided there are a minimum number of trainees. Certification received upon successfully finishing it is good for three years.

A telescopic handler (also referred to as a telehandler) is similar in some ways to both a crane and a forklift. It is a useful machinery constructed together with a telescopic boom that can lift upwards and extend forward. Different attachments could be fitted on the end of the boom, such as pallet forks, bucket, lift table or muck grab. It is popular in agriculture and industry settings.

The telehandler is a common used together with fork attachments to be able to enable the transporting of loads. Telehandlers have the advantage of being able to reach those inaccessible places which cannot be reached by a standard forklift. Telehandlers could remove loads which are palletized from within a trailer and putting them on high places like for example rooftops. For some applications, they can be more efficient and practical as opposed to a crane.

The disadvantage of the telehandler is its instability when lifting loads that are heavier. When the boom extends with a load, the unit becomes ever more unstable. Counterweights in the rear help, but don't solve the problem. As the working radius increases, the lifting capacity quickly decreases. Some machines come along with front outriggers which extend the lifting capacity when the machine is stationary.

A load chart helps the operator to determine whether a given load is too heavy. Factors like boom angle and height and load weight are calculated. Several telehandlers have sensors that cut off further control or provide a warning if the unit is in danger of destabilizing.
